

Technical Assurance Report — v3 Package

Every load-bearing technical claim, verified against a live Odoo 19.3 Enterprise instance — MDR Devices Medizintechnik GmbH

METHOD — WHY THIS IS STRONGER THAN A DOCUMENTATION REVIEW

This is not a re-read of the documents against Odoo's manuals. Every claim below was executed or read back **against the actual running trial instance** (`mdr-devices-test.odoo.com`, server version `saas~19.3+e`) over the XML-RPC API. Where a control is marked **FIRED LIVE**, a real transaction was attempted and the system's response captured. Where a fact is marked **READ LIVE**, it was read from the live schema or data, not asserted from memory. This report also records two concrete technical gaps found and fixed during this pass.

1 Case Requirement Coverage — against the original brief

BRIEF REQUIREMENT	COVERED	EVIDENCE / MECHANISM (VERIFIED)
Sales/CRM — physician certification records, order-time compliance	LIVE	Credential fields on <code>res.partner</code> ; order-confirmation gate fired live — expired physician hard-blocked, locum routed to review
Sales/CRM — consignment stock in hospitals	LIVE	Hospital modelled as internal location; implant physically at Klinikum München, valued on MDR's books (now €1,200, see §3)
Logistics — full UDI traceability every implant	LIVE	DI + GS1 AI-structured PI on <code>stock.lot</code> ; one-click genealogy vendor → patient; GS1 nomenclature confirmed native
Logistics — sterility protection	LIVE	Native expiration/removal/alert date fields present and in use; sterility clock on the lot
Logistics — temperature-controlled storage	SCOPED	Cold-chain envelope fields present; sensor/logger data source correctly named as a discovery integration — not overclaimed
Logistics — JIT delivery for planned surgeries	CONFIG	Delivery scheduled against confirmed surgery date; standard scheduling
Purchasing — auto-replenish below 3-month quality hold	LIVE	Reordering rule scoped to <code>WH/Stock</code> (post-hold), so quarantined stock never triggers replenishment
Purchasing — quality-hold on raw materials	LIVE	90-day hold auto-stamped on receipt; release blocked live until hold elapses + QC pass
Accounting — cost-center booking, multi-stage claims/rebates	LIVE	Three analytic plans applied on the posted invoice (<code>{1,2,3}: 100%</code>); payer-split correctly scoped as extension (see §2)
CEO — real-time transparency + end-to-end compliance	LIVE	Single-query traceability + one operational picture; the whole thread is one data model
Reusable instruments (named in brief alongside implants)	LIVE	Asset loop with cycle count; reuse-limit dispatch blocked live at 50/50

2 Technical Claim Verification — line by line

CLAIM AS WRITTEN IN THE PACKAGE	VERDICT	WHAT THE LIVE SYSTEM ACTUALLY SHOWS
<code>stock.production.lot</code> renamed to <code>stock.lot</code> in Odoo 16	CONFIRMED	<code>stock.lot</code> exists; <code>stock.production.lot</code> does not — read live
Multi-plan analytics native, introduced Odoo 16 (F1 correction)	CONFIRMED	4 analytic plans live; posted invoice line carries a 3-plan distribution resolved at generation
GS1 Application Identifier parsing is native (Barcode app)	CONFIRMED	“Default GS1 Nomenclature” present; <code>barcode.rule.gs1_content_type</code> field exists — read live
GS1 AIs: batch=(10), serial=(21), expiry=(17)	CONFIRMED	Correct GS1 standard AIs; now reflected in the live <code>x_udi_pi</code> composite (see §3)
Native expiration-date feature governs sterility clock	CONFIRMED	<code>expiration_date</code> , <code>removal_date</code> , <code>alert_date</code> , <code>use_date</code> , <code>use_expiration_date</code> all present on <code>stock.lot</code>
Two-payer invoice split is NOT native — extension layer (F2 correction)	CONFIRMED	A sale order carries a single invoice partner (<code>partner_invoice_id</code>) — the correction is right; the split is correctly scoped as extension
Consignment stock stays on the balance sheet via internal location type	CONFIRMED	Consignment location <code>usage = internal</code> , read live; only a customer/loss move removes value. Now grounded with a real standard cost (§3)
Audit trail via chatter + field tracking on critical models	CONFIRMED	<code>message_ids</code> present on <code>stock.lot</code> , <code>quality.check</code> , <code>account.move</code> — read live
Credential gate blocks confirmation on invalid HCP (TC-01)	FIRE LIVE	Order for expired physician raised the block; order stayed in draft
Quarantine hold blocks early release (TC-05)	FIRE LIVE	Transfer of held lot out of quarantine raised the GxP block; lot stayed held
Reusable-instrument reuse-limit blocks dispatch (TC-14)	FIRE LIVE	Dispatch of a 50/50-cycle tray refused — confirmed in prior pass, control still active
e-signature: Odoo has no native dual-auth release; two-step gate is the design	CONFIRMED	Accurate platform boundary; the two-step gate is honest and correctly labelled Category 5

TWO NUANCES A SHARP CIO COULD RAISE — GET AHEAD OF THEM

1 • Valuation is Periodic on this trial, not Perpetual. The on-balance-sheet *mechanism* (internal location) is correct and now carries a real standard cost, so the consignment stock shows a genuine €1,200 asset value. But this trial's product category uses *Periodic* valuation — live automated General-Ledger postings on each move would require switching the category to *Perpetual* (at invoicing) and wiring stock input/output/valuation accounts. That is a deliberate configuration step in the real build, not a native default. Say “the stock is on our books, valued at standard cost” — do *not* claim live journal entries post automatically on this trial.

2 • MRP on 19.3 uses `lot_producing_ids` (plural). No document references the old singular field name, so nothing needs changing — but anyone scripting against manufacturing orders should know the 19.x field is plural.

3 Gaps Found & Fixed This Pass — what the earlier (free-model) build missed

GAP	SEVERITY	FIX APPLIED TO THE LIVE INSTANCE
Implant product had zero cost — the “on the balance sheet” story had no € value behind it	MATERIAL	Standard costing enabled; implant €1,200, raw €120, tray €3,000. Consignment stock now shows a real €1,200 on-book asset physically located at the hospital — the valuation claim is no longer abstract
<code>x_udi_pi</code> (composite Production Identifier) listed in the Object Schema but absent from the instance — doc/instance drift	PARITY	Field created and populated with the GS1 AI-formatted composite, e.g. <code>(10)LOT-2607-A(21)SN-HC-0003(17)...</code> — the schema now matches the running system exactly
Product category costing method unset (defaulted with no explicit method)	HYGIENE	Goods category set to Standard Price costing — removes a data-quality smell a valuation-literate reviewer would notice

After every change above, both headline gates were **re-fire-tested and still block correctly** — the costing and field edits introduced no regression. This is the discipline that separates a demo that survives scrutiny from one that breaks on the first probing question.

4 Verdict

ASSURANCE STATEMENT

Every load-bearing technical claim in the v3 package is **accurate against a live Odoo 19.3 Enterprise system**. The version-dated facts (model rename, analytic plans), the native-capability claims (GS1 parsing, expiration dates, analytic distribution, chatter audit trail), and the three enforced controls (credential gate, quarantine hold, reuse limit) all verified — the controls by real blocked transactions, not description. The two honest boundaries the package already carried (payer-split as extension; e-signature as a designed two-step gate) are confirmed correct, not overstated.

The package is technically defensible for a Principal-level panel. The two items to state precisely rather than overclaim — Periodic vs. Perpetual valuation, and cold-chain sensor integration as discovery scope — are now documented above so they become confident, prepared answers instead of exposed gaps. **Nothing in this package rests on a technical claim that the live system contradicts.**

Verified against `mdr-devices-test.odoo.com` · `saas~19.3+e` · via authenticated XML-RPC · all test records created for fire-tests were removed afterwards; demo props (held lot, consigned implant, retired tray, returned implant) left in place intentionally.
