The Compliant Digital Thread under the United Kingdom's new medical-device regime — a head-start for the UK practice

Prepared by Waqas Abbas Mian · Senior ERP Solution Architect — a forward note for much. Consulting's UK team

1 · Why I wrote this

The MDR Devices case is a German company under EU MDR, and the solution I built answers it end to end. But the role I am interviewing for is in the UK practice — and I did my homework on where that practice is heading rather than only on the case in front of me. much. already runs one of Europe's strongest MedTech Odoo verticals; your published solution covers EU MDR, FDA, ISO 13485/14971, GxP, GAMP and EUDAMED with real depth. One thing sits just over the horizon of that page: the United Kingdom, where the new office will win work, **diverged into its own medical-device regime in 2025–2026** — and it asks for very nearly the same thing the Compliant Digital Thread already does. This note maps that overlap, names the small delta honestly, and offers it as a head-start rather than a critique. It is deliberately not part of the MDR Devices pitch; it is the homework behind it.

2 · What changed in the UK — the facts, dated

REFORM	WHAT IT REQUIRES, AND WHEN
Post-Market Surveillance regulations	The Medical Devices (Post-market Surveillance Requirements) Regulations came into force on 16 June 2025 : formal PMS plans, structured adverse-event reporting, Periodic Safety Update Reports (PSURs) for higher-risk classes, and serious-incident reporting cut from 30 days to 15 days .
UDI & implant cards	Mandatory adoption of Unique Device Identification and implant cards for implantable devices to strengthen traceability — mirroring EU MDR Articles 27 and 18, registered through MHRA rather than EUDAMED.
Draft Medical Devices (Amendment) Regulations 2026	Pre-market reform published in draft: expanded technical-documentation requirements and extended retention — device lifetime + 10 years, and 15 years for implantable devices .
UKCA & CE recognition	The UK's own UKCA conformity mark, alongside transitional CE recognition (to 2028/2030) and an MHRA consultation on indefinite CE recognition open 16 Feb – 10 Apr 2026 . Plus new international-reliance routes leveraging trusted overseas regulators.

Competent authority: the **MHRA**, not EU notified bodies or EUDAMED — the same obligations, a different addressee.

3 · The bridge — the thread already answers most of it

Set the UK regime against what the demonstration system already does, and the overlap is close to total. The green rows are already built; the amber row is the honest delta — small, named, and exactly the kind of extension the main proposal is built to scope.

COMPLIANT DIGITAL THREAD (BUILT FOR EU MDR)	UK 2025–2026 REQUIREMENT	FIT
UDI on every serial — DI plus GS1-structured PI (10/21/17)	Mandatory UK UDI adoption	DIRECT — RE-POINT REGISTRATION TO MHRA
Implant-card generation at Surgery Complete (Horizon 2)	Mandatory implant cards for implantables	DIRECT — UK FORMAT/LANGUAGE

Structured post-market surveillance trend watch (Horizon 2 / governed AI)	PMS plan, PSURs, 15-day serious-incident clock	DIRECT — ADD PSUR CADENCE & 15-DAY TIMER
Archive-only audit trail with retention clock on the lot	Retention: device life + 10y, 15y implantables	DIRECT — SET UK RETENTION CLOCK
Quality gates & QMS discipline on an ISO 13485 basis	ISO 13485 basis unchanged	DIRECT
EUDAMED registration autopilot (Horizon 2)	MHRA registration · UKCA vs CE recognition · international-reliance logic	THE DELTA — A UK REGISTRATION & MARKING LAYER

THE WHOLE POINT ON ONE LINE

Roughly ninety per cent of the UK's new medical-device obligations are already satisfied by the thread built for a German manufacturer. The gap is a single named extension — a UK registration-and-marking layer that swaps EUDAMED for the MHRA and adds the PSUR cadence. That is not a rebuild; it is a bridge.

4 · Why this matters to the UK practice, commercially

Every UK medical-device manufacturer is being forced to re-tool for this regime between now and 2028 — the PMS rules already bite, the pre-market reforms are landing, and the retention and traceability obligations reach back across existing product lines. A UK Odoo practice that can walk in with a **validated, UK-ready regulated-manufacturing accelerator** — much.'s existing MedTech solution, extended by this bridge — meets that wave before a generic Odoo partner has even scoped it. The MDR Devices work is the proof asset; this note is the reason it travels.

STATED HONESTLY

I am not claiming to have built the UK layer — I have mapped it, dated it, and sized it. The specifics (MHRA registration mechanics, UKCA conformity routing, the reliance-route logic) are a scoped discovery workstream, exactly like the EUDAMED interface in the main proposal. What I am offering is the foresight and the head-start: the homework a UK team would otherwise do in its first month, done before the interview.
