

Change Log — Package v2

Every Round 5 finding, its severity, and exactly where the fix landed — verifiable against the live documents

Provenance. Rounds 1–4 were produced and audited within one AI lineage (plus one cross-reference against an externally generated package). Round 5 was an independent review by a different reviewer with live verification against Odoo official documentation and much. Consulting's published MedTech material — it confirmed the package's central positioning and found five errors/overclaims all prior rounds had missed. This log records their implementation. Historical audit reports (Rounds 1–4) are retained unmodified; where a Round 5 correction supersedes a statement inside them, this log is the authoritative record.

ID	SEVERITY	FINDING	FIX — LOCATION IN V2
F1	FIXED	Multi-plan analytics attributed to Odoo 17; analytic plans/distributions actually replaced analytic tags in Odoo 16 (verified against Odoo 16 official documentation).	Object Schema §4.1 — “introduced in Odoo 16.”
F2	HIGH FIXED	Two-payer invoice split (insurer + co-pay) claimed as native. A sale order natively invoices a single partner; down-payment/milestone invoicing splits amounts over time for the <i>same</i> customer only.	Object Schema §4.2 rewritten (split is extension, two-way and multi-tier; analytic spine stays native) · Value Stream Stage 6 rewritten · Deck Slide 9 copy + speaker notes re-worded · Script Slide 9 rewritten · Blueprint Slide 9 · GxP TC-08 reclassified extension · Rebuttal Objection 8 added · Extension item renamed “Multi-Payer & Rebate Settlement” everywhere.
F3	MED-HIGH FIXED	Automated tiered vendor-rebate credit notes claimed as native; no out-of-the-box Odoo engine watches cumulative volume thresholds and generates vendor credit-note claims.	Object Schema §4.3 rewritten (native data, extension automation; recovery argument retained) · Memo “Recovery” callout re-worded · new regression test TC-19 · covered by renamed extension item (3).
F4	FIXED	“EU MDR Annex 11” — Annex 11 is EU GMP (EudraLex Vol. 4), not the MDR; also “ISO 13485 device history record” conflated 21 CFR 820 terminology.	GxP Plan §3 and §4 corrected to “EU GMP Annex 11 (EudraLex Vol. 4), applied as the accepted GxP benchmark” · Value Stream traceability statement now cites DHR (21 CFR 820) and medical device file (ISO 13485) correctly · Rebuttal Objection 4 answer carries the precision.
F5	MED-HIGH FIXED	Rehearsed answer called the 90-day hold “a regulatory floor” — no regulation mandates it; the brief describes a company quality-hold requirement, and the brief's sentence is itself ambiguous (hold vs. coverage trigger).	Object Schema §3.2 callout (policy, not regulation; ambiguity named as discovery question) · Value Stream Stage 2 release-condition note · Script Slide 8 line extended · Rebuttal Objection 6 added with corrected model answer · Cue card beat: “never say regulatory floor.”
F6	FIXED	Field Service triggers Stage 5 and CRM holds credential records, but the architecture claimed “five native applications” without naming either.	Deck Slide 5 copy + notes · Memo solution paragraph · Object Schema architectural principle · Script Slide 5 · Blueprint Slide 5 · Cue-card spine.
F7	FIXED	SO delivery routed to an internal consignment location, and invoicing triggered by the consumption move, presented with native-sounding smoothness — both are deliberate route/automation configuration, not default behaviour.	Object Schema §1.3 “Design note, stated plainly” · Value Stream Stage 4 design note + Stage 5 wording.

F8	FIXED	Cold-chain envelope fields implied a data source; where temperature readings actually come from (logger import vs. IoT feed) was unscoped.	Object Schema §2.2 callout · Value Stream Stage 2 · Rebuttal Objection 13 · Cue-card beat.
F9	CLOSED	Deck never visually verified. Structural validation re-run on v2 deck (12 slides, valid OOXML, no off-canvas geometry, edited text confirmed in place). A rendered visual check in PowerPoint/Keynote remains the final manual step before sending.	v2 deck saved with Slide 5 and Slide 9 edits; verification note here.

Also added in v2 (from the Round 5 boardroom simulation)

- **Eight new objections with model answers** (Rebuttal Playbook Part II): 90-day regulation source · personal Odoo track record · the two-payer field challenge · version choice & upgrade cadence · running costs · LIMS end-state · duration & client FTE ask · temperature data source.
- **LIMS end-state position** — GxP Plan §6: quality process consolidates into Odoo Quality; lab instrumentation capture integrates rather than migrates, confirmed in discovery.
- **JIT scheduling line** — Value Stream Stages 3.1/4: consignment deliveries scheduled against the confirmed surgery date.
- **Version proposal** — GxP Plan §7: current stable Odoo Enterprise on Odoo.sh with controlled upgrade cadence.
- **Cue card v2** — spine and beats updated; four newest beats flagged for hardest drilling.

Deliberately NOT changed

- **Historical audit reports (Rounds 1–4)** — retained verbatim as the audit trail. Where Round 5 supersedes them (notably the “regulatory floor” line in the Round 1 simulation and the “two-way split is native” framing), this change log governs.
- **The fee placeholder** — still “fixed at kickoff.” Only the firm's rate card can fill this; inventing a number would be false precision.
- **Claims still requiring sandbox verification** — flagged in place, not asserted as tested: consignment per-location valuation reporting; the consumption-triggered invoicing automation. These are the candidate's live-sandbox checklist, not document work.
