

Strategic Memorandum

Odoo Enterprise Implementation — The Compliant Digital Thread

To	Executive Board, MDR Devices Medizintechnik GmbH
From	much. Consulting
Re	Odoo Enterprise Implementation — The Compliant Digital Thread
Distribution	CEO, CIO, Board Pre-Read (day prior to pitch)

The Problem — Not Software Sprawl. Regulatory and EBITDA Exposure.

MDR Devices operates four disconnected systems of record — quality management, LIMS, field service, and a legacy ERP — governing a single, continuous clinical event: an implant's journey from vendor receipt to patient use. Framed as a tooling inconvenience, this looks like an IT modernization project. Framed correctly, it is a standing EU MDR Article 27 traceability liability and a working-capital drag that compounds with every SKU added to the catalog. Every day this persists, MDR Devices carries audit risk it cannot fully price, and reconciliation overhead across quality, logistics, and finance that shows up nowhere on a P&L line item labeled “root cause.”

The Diagnosis — Why the Current Requirements Effort Cannot Close This Gap

Asking each department what it “does in the ERP” returns functional answers — screen fields, report formats — never the underlying process constraint each department is quietly relying on the others to honor. Sales assumes Logistics enforces cold-chain integrity; Logistics assumes Quality has already cleared the lot; Quality assumes Sales won't ship to an uncertified physician. None of these assumptions are written down anywhere, and none are enforced by a system — they are enforced, inconsistently, by tenure and habit. A bottom-up survey of five departments will always return five local optimizations and zero shared definition of “compliant end-to-end.” That definition has to be architected, not collected.

A standing EU MDR Article 27 traceability liability and a working-capital drag that compounds with every SKU added to the catalog.

The Solution — The Compliant Digital Thread

We propose a single validated data backbone — the Compliant Digital Thread — built on native Odoo Enterprise applications (Inventory, Manufacturing, Quality, Sales, Accounting, with Field Service and CRM completing the thread at the point of surgery and the physician record) for the majority of the flow, extended with a purpose-built MedTech layer precisely where standard Odoo stops short. This mirrors the same vertical-extension pattern we have already proven across other regulated device manufacturers — native configuration wherever it holds up under audit, targeted extension where it doesn't.

CREDENTIAL-GATED SALES

Sales cannot confirm an order against an expired or unqualified physician credential — compliance becomes a system constraint, not a training expectation.

END-TO-END UDI

Every implant carries a structured, parsed UDI from receipt through consumption, with sterility and cold-chain data attached to the lot record itself — consignment stock held on MDR Devices' own balance sheet throughout.

AUTOMATIC QUALITY HOLD

MULTI-PAYER SETTLEMENT

Page 1 of 3

The mandated quality hold is enforced automatically — stock is not pickable until both the quality check passes and the hold period elapses, removing dependency on manual tracking.

Every payer invoice reconciles structurally against the clinical consumption event through one shared analytic thread — with the payer-split invoicing itself delivered by our named MedTech extension layer, scoped to your actual payer mix, not claimed as out-of-the-box.

The Value — What This Delivers to Each Stakeholder

CEO	Real-time operational transparency — dashboard state reflecting actual process state, not a report reconstructed from four disconnected sources.
CIO	A build where the overwhelming majority of the flow runs on native configuration with materially reduced upgrade risk, and a clearly scoped, separately validated extension layer — not an undifferentiated custom-code footprint.
ORGANIZATION	A compliance posture that is structural rather than procedural — passing an audit because a control exists in the system, not because staff remembered a procedure correctly.

RECOVERY, NOT JUST EFFICIENCY

Comparable deployments in regulated device manufacturing have cut audit-evidence compilation from weeks of manual record assembly to a same-day system export. The sharpest near-term number, though, is recovery: automated vendor rebate matching — extension-layer logic running on your native purchase data — stops MDR Devices under-collecting volume rebates it has already contractually earned. A figure a CFO can defend in a board meeting far more easily than a projected saving.

This is not a migration. It is the first time MDR Devices will have one system of record for what “compliant” actually means, end to end. Built well, the pattern behind it — native core plus a precisely named extension layer — is also the thing much. Consulting brings to the next MedTech engagement at a fraction of the discovery cost, not a one-off build.
