

Pitch Accuracy & Quality Audit

Independent Review — Odoo Architecture Claims, Business Fit, and Production Quality

METHODOLOGY

Every technical claim in the package was checked against current Odoo official documentation (v16–v19), Odoo community/partner sources, and — critically — much. Consulting's own published MedTech positioning (muchconsulting.com/blog, "Why Odoo is ideal for MedTech companies," Sept 2025). That last source matters more than any Odoo doc: it's the actual firm's real methodology, and the pitch should sound like it came from inside that firm, not from generic Odoo knowledge.

FINDING 1 The Pitch Contradicts much. Consulting's Own Business Model

HIGH PRIORITY

Severity: High. This is the single most important fix.

The current package leans hard on "zero custom code / native Odoo only" as the headline architectural virtue (Slide 5, GxP plan, Object Schema doc). That's a reasonable engineering instinct, but it directly contradicts how much. Consulting actually sells this work. Their own site states plainly: "Odoo provides a solid foundation for a MedTech system, but there are still core requirements that are not covered by its Standard version... we developed a vertical solution for MedTech that builds on top of Odoo ERP" — covering enhanced traceability, vendor compliance management, batch recalls, regulatory dashboards, and automated validation testing.

If a candidate stands in front of a much. Consulting partner and says "we need zero custom development," that reads as either not having researched the firm, or undercutting the exact service line the firm is built to sell. The stronger, more credible position — and the one that matches real Odoo limitations found in this research — is: **native-first, with a clearly named MedTech extension layer where standard Odoo genuinely stops short.**

FIX DIRECTION (FOR THE ACTION PASS)

Reframe Slide 5, the GxP plan intro, and the Object Schema doc around "native Odoo Enterprise for 80% of the flow — Sales gating, quarantine automation, analytic billing — extended with a purpose-built MedTech traceability layer for UDI structuring, batch recall management, and regulatory dashboards," explicitly naming those as the kind of vertical extension much. Consulting already builds. This also gives the candidate a natural line to say "I've read your MedTech work and I'm proposing the same pattern" — which is a genuinely strong interview move.

FINDING 2 Factual Error: Model Rename Timing

MEDIUM

`01_Odoo_Core_Object_Schema` states `stock.production.lot` was renamed to `stock.lot` "as of v17+." Official Odoo forum sources confirm the rename happened **Odoo 15 → 16**, not 17. Minor, but exactly the kind of detail a technically sharp CIO or the much. Consulting Lead Partner would catch and use to question the rest of the technical depth. Needs correcting to "renamed in Odoo 16."

FINDING 3 **Consignment Mechanism Invents a Workaround Instead of Citing Odoo's Real Native Feature**

MEDIUM

The package proposes modeling hospital consignment via nested “internal” locations to keep stock on the balance sheet. That instinct is directionally right, but Odoo has an actual **native ownership mechanism** for exactly this — the `owner_id` field on `stock.quant` /stock moves, used specifically to track consignment and non-owned stock while controlling valuation behavior. Citing the real native field name is both more accurate and more impressive than presenting a custom location-nesting pattern as the primary solution. This should be corrected to lead with the native ownership field, with location structure as a secondary, supporting design choice.

FINDING 4 **Overstated Certainty on Studio Upgrade Safety**

MEDIUM

Slide 5 and the script claim Studio-built fields and automated rules survive major version upgrades essentially risk-free. This is directionally true — Studio customizations are stored as data (fields, automated actions) rather than external code, so they carry forward far more reliably than bespoke Python modules — but Odoo's own upgrade documentation does not promise zero adjustment. Complex automated actions occasionally need review after a major upgrade. The current phrasing (“a stable upgrade path,” stated as near-absolute) should be softened to “materially lower upgrade risk than custom code, with configuration review — not a rebuild — at each major release.” A CIO who has lived through an Odoo upgrade will respect the honesty; overselling this is a credibility risk in exactly the persona (CIO, stability-focused) this pitch is designed to win over.

FINDING 5 **UDI Parsing Claim Needs Precision**

LOW-MEDIUM

The claim that DI/PI parsing “reuses Odoo's existing barcode nomenclature engine” is accurate at the GS1-parsing level — Odoo's Barcode app does natively parse GS1 Application Identifiers into structured fields. But splitting that further into dedicated `x_udi_pi_batch` / `x_udi_pi_serial` / `x_udi_pi_expiry` custom fields, specifically for MDR/UDI compliance reporting, is exactly the kind of “fill the gaps in Odoo standard” work much. Consulting's own site claims as their differentiator. Recommend explicitly labeling this as an extension, consistent with Finding 1's reframe — it strengthens rather than weakens the pitch once positioned correctly.

FINDING 6 **Electronic Signature Gap: Correctly Identified, Keep As-Is**

STRENGTH — NO CHANGE

This is a genuine strength of the current package, not a flaw. Odoo does not ship dual-authentication e-signature for quality release out of the box, and much. Consulting's own real case study (pacemaker manufacturer, Class III device) describes solving this with “electronic approvals embedded in daily operations” — i.e., a designed workflow control, exactly matching the two-step QA release gate already proposed here. No change needed; if anything, the rebuttal script (Objection 4) should reference that this is a well-trodden pattern in regulated Odoo deployments, not a first-of-its-kind risk.

FINDING 7 **Missing Quantified Proof Points**

MEDIUM

Every deliverable is qualitative. much. Consulting's own published case studies carry a concrete, repeatable stat pattern worth mirroring — e.g., “audit reports generated in hours instead of weeks,” “full traceability report from design through manufacturing and testing.” The pitch currently has zero numbers. Recommend adding at least one or two comparable estimates (audit prep time reduction, reconciliation hours saved per month in Finance) to the pre-read memo and Slide 10 — even directional, labeled-as-estimate figures outperform pure qualitative claims in front of a CEO persona focused on cost and growth.

FINDING 8 Markdown Formatting Pass**CLEAN — NO ACTION**

All seven source documents were checked for broken markdown (unmatched bold/italic markers, malformed tables, stray characters, irregular header levels). **No formatting defects found** — headers are consistent, tables render correctly, bold usage is intentional and load-bearing rather than decorative. No action needed here.

FINDING 9 PPTX Production Notes**LOW**

The 12-slide deck has been built as an actual `.pptx` (not just the blueprint) with a consistent navy/accent color system, real shape-based diagrams (kanban board, chevron flow, funnel, connector diagrams) rather than plain bullet text, and speaker notes populated from the verbatim script. No overlapping text or empty-slide gaps detected in generation. Recommend one manual pass in PowerPoint/Keynote to check line-wrap on the longest text boxes (Slide 6 and Slide 11 body copy) at your actual presentation resolution, since wrap behavior can shift slightly across renderers.

SUMMARY RANKING FOR THE ACTION PASS

1. Reframe “zero custom code” → “native-first + named MedTech extension layer” across Slide 5, GxP plan, Object Schema doc
HIGH
2. Fix `stock.production.lot` → `stock.lot` rename date (v16, not v17) **MEDIUM**
3. Replace invented consignment-location workaround with Odoo's native `owner_id` consignment field as the lead mechanism
MEDIUM
4. Soften Studio upgrade-safety claim to “materially reduced risk,” not “risk-free” **MEDIUM**
5. Reframe UDI parsing extension as intentional MedTech-layer work, matching Finding 1 **LOW-MEDIUM**
6. Add 1–2 quantified proof points to memo + Slide 10, styled after much. Consulting's real case studies **MEDIUM**
7. No action needed: e-signature gap framing (correct as-is), markdown formatting (clean), PPTX structure (clean, light manual QA recommended) **CLEAN**
