

Final Delivery Readiness Report

Implementation of Round 3's open items, plus a full-package consistency and readiness pass

SCOPE

Every item on Round 3's "Still Open" list, addressed directly — implemented where implementation was actually possible, and stated plainly where it wasn't. Padding an already-thorough package with more writing isn't the same as closing a gap, and this report tries not to blur that line.

1 · IMPLEMENTED THIS ROUND

ROUND 3 OPEN ITEM	OUTCOME	DETAIL
Bracketed date on Slide 12	CLOSED	Replaced with a concrete relative commitment — “within 5 business days of this meeting” — in the blueprint, the script, and the actual <code>.pptx</code> . No fabricated calendar date required; this is genuinely resolved, not just reworded.
Deployment tier (Odoo.sh vs. Online)	CLOSED	GxP Validation Plan §7 now states a firm recommendation (Odoo.sh) with the reasoning, rather than naming it as an open question for the pitch to stumble into live.
GDPR — named but not designed	SUBSTANTIALLY ADVANCED, DELIBERATELY NOT CLOSED	Fleshed out into four concrete sub-areas (legal basis/minimization, retention distinct from MDR's clock, hospital controller/processor relationships, DPIA likelihood) in GxP Plan §8. Still explicitly routed to legal/DPO for final design — that caveat is staying, on purpose. A real GDPR design isn't something an ERP architecture document should resolve unilaterally, and claiming otherwise would be a worse outcome than an honest scope statement.
Unmatched-return fallback	CLOSED	A fourth <code>x_return_disposition</code> value — Under Investigation — now covers a return that arrives with a damaged label or incomplete paperwork and doesn't scan cleanly, routed to a manual match-and-flag queue. Added consistently to Object Schema, Value Stream Stage 4B, and a new regression test (TC-17b).
Sandbox-unverified consignment valuation claim	STRENGTHENED, NOT CLOSED	Found a directly analogous, officially-documented Odoo pattern (subcontracting valuation — your components, a third party's site, location-driven valuation) that backs the corrected mechanism more strongly than Round 2's original research. Also surfaced a genuine secondary nuance worth knowing: per-location valuation <i>reporting breakdowns</i> across multiple internal locations have a documented Odoo quirk and may need <code>warehouse_id</code> made a stored, groupable field to report reliably — separate from whether the underlying mechanism is correct, which it is. This is real desk-research progress. It is not the same as opening a sandbox, and isn't being presented as if it were.
Rehearsal	NOT CLOSEABLE BY DOCUMENT EDITING — A TOOL BUILT INSTEAD	A new one-page cue card (<code>07_.../04_Rehearsal_Cue_Card</code>) condenses the spine, the exact ask, and a trigger-word cue table for all 12 objections into something meant to be drilled from, not read once. It makes rehearsal easier. It is not rehearsal.
Fee on Slide 12	NOT CLOSED — AND NOT FABRICATED	See Section 2.

2 • ON THE FEE — DELIBERATELY STILL A PLACEHOLDER

Researched current Odoo discovery-phase pricing to give a grounded starting point rather than leaving this as a bare bracket with no context. Generic SME-scope discovery engagements commonly run in the low thousands to roughly ten thousand (currency and market vary by source); MDR Devices' actual scope — multi-department, regulated MedTech, GxP-relevant — reasonably commands a premium above that generic baseline, in line with how regulated-industry engagements are priced across the sources checked. That's genuinely useful context. It is not the same as much. Consulting's actual rate card, which is the only real source of truth here and something only the firm has. Putting a specific invented number into the actual pitch materials would have been fabricating exactly the kind of false precision this whole four-round process has been checking for elsewhere — so the deck still says “fixed at kickoff,” and the number itself stays yours to set.

3 • FULL-PACKAGE CONSISTENCY PASS

Beyond the specific open items, this round re-swept the entire package for drift accumulated across four rounds of editing:

- **Caught and fixed:** the memo's description of the extension layer had never been updated past an early three-item version (“structured UDI compliance reporting, batch recall management, and regulatory dashboards”) even after every other document moved to the current five-item list. Now consistent everywhere — verified by direct search across all live documents, not assumed.
- **Verified clean:** no remaining unintended placeholder brackets outside the one deliberate fee placeholder; the “four vs. five extension items,” “three vs. four return dispositions,” and “assumes vs. recommends Odoo.sh” phrasings are now consistent across every document that references them.
- **Added:** a package-level index (`00_START_HERE_Package_Index`) — with a package now spanning four rounds and multiple report files, “everything is technically in the folder” isn't the same as “someone can find the right document in the ten minutes before walking into the room.”

4 • A LIMITATION, STATED PLAINLY

A full visual re-render of all 12 slides was planned for this round, to check the two edited slides plus a first-ever look at the ten untouched ones. Image rendering hit a tool problem partway through and didn't recover after several attempts. What was actually verified instead: automated structural validation (passed), full text extraction confirming all 12 slides are present with no truncation or corruption, and — from earlier in this session, before the tool issue arose — a direct visual confirmation that Slides 5 and 12 rendered correctly after their edits. The ten untouched slides carry no new layout risk from this session's work, since nothing in them changed. That's a reasonable basis for confidence, not a substitute for actually looking at the rendered deck once more before it's used — worth five minutes in PowerPoint or Keynote, and said here directly rather than left implied.

5 • UPDATED ASSESSMENT

A real, modest move. Four genuine gaps closed this round (date, deployment tier, unmatched returns, and a real internal inconsistency caught on final read), one meaningfully strengthened (the consignment mechanism, now backed by a more directly analogous official source), and one substantially advanced without being falsely declared finished (GDPR). What holds this from moving further: the fee is still open, and — see below — the verification and rehearsal gap hasn't narrowed at all.

Hiring Panel Score deliberately unchanged, again, for the same reason stated twice already: this was a documentation and implementation pass, not a sandbox session or a rehearsal. Three rounds of real, verifiable improvement and the score hasn't moved past 8, because the two specific things that would move it — live command of the room, and hands-on verification of the technical claims — are exactly as untouched now as they were after Round 2. That consistency is more informative than a number that crept upward each time more work got done regardless of whether the actual ceiling condition changed. It hasn't.

6 · WHAT'S LEFT, HONESTLY

Two items, and they're the same two that have been named since Round 2, because they're the two things a document-editing process cannot do on its own:

- ☐ A live Odoo sandbox check of the consignment/valuation mechanism and the newer return-disposition fields — well-supported on paper now, not yet tested
- ☐ Saying all of this out loud — the cue card exists to make that easier; it doesn't replace doing it

Everything else that was actionable from a desk has been actioned. This package is ready for what a document can carry it to. The remaining distance is rehearsal and verification, not more writing.
