

Market & Viability Assessment

Is the UK opportunity real, how big, and why now

1. The UK market is real, large, and growing fast

Metric	2025/2026 figure
MCS-certified UK installers (all technologies)	5,250+ (highest since MCS began in 2008)
MCS-certified solar PV installers	4,000+
Solar PV systems installed in the UK, 2025	267,032 — a 31% jump over the prior record (2011)
Heat pump installations, 2025	60,000+ — the most in a single year ever
Cumulative UK heat pump installs (since 2009)	250,000+ (passed February 2026)
2026 forecast growth	+50% year-on-year
Government heat pump installation target	600,000 per year by 2028 (from the 2020 Ten-Point Plan)

Why now, specifically: the Boiler Upgrade Scheme grant (up to £7,500 off a heat pump), 0% VAT on solar installations (through March 2027), and the MCS mandate itself are structural, government-driven tailwinds pushing installer businesses to scale fast — and scaling installer businesses is exactly when they outgrow spreadsheets/WhatsApp and start shopping for a CRM. The market isn't just growing; it's growing for reasons that specifically create CRM demand (more jobs, more compliance paperwork, more subcontractor coordination).

2. Regional context: Manchester as a launch hub

Greater Manchester has a confirmed, government-body-published target of **carbon neutrality by 2038** — 12 years ahead of the national 2050 target — directly confirmed by the Greater Manchester Combined Authority's Five-Year Environment Plan. This correlates with genuine trade-contractor density in the North West and is a defensible reason to anchor the UK launch there, independent of anything else in this package.

3. Viability verdict

On the evidence gathered: this is a defensible, fundable opportunity, not a speculative one. A proven product (600+ deployments, 15,000+ users, real named references — see Folder 01), a genuinely growing target market with structural regulatory tailwinds, and a specific, nameable gap (the UK brand exists on paper but not in operational reality) that a hands-on local partner is positioned to close.

The real risk isn't "does this market exist" — it's: 1. **Execution risk** — can you actually win against established players already in this exact niche (see Folder 03). 2. **Partnership risk** — whether the actual deal structure (still unresolved — see Folder 13, Question 1) is one that can be executed cleanly and doesn't collapse under a disagreement later (see Folder 07).

Neither of these is a reason not to proceed — both are reasons to resolve them explicitly before committing capital or time at scale.
